K Appendix: Token and Dollar Costs

All evaluation results are produced via API, which is either the provider API for closed-source models or a Hugging Face Inference Provider for open-weight models; inference providers for each model are listed in Appendix E. Table 1 and Table 2 contain the total and average tokens spent per generation for the evaluated model, across all LLM runs. Table 3 and Table 4 contain the total and average tokens spent per generation for each of the judge models, across all LLM runs. Note that these tables contain token counts for the main results, token and reasoning ablations, LLM responses to the human baseline items, and LLM-as-a-judge runs used to grade the human responses on the human baseline. Total inference costs were in the high four figures (in USD).

The Bayesian GLMMs are fit on a Runpod instance with 4 x Nvidia RTX PRO 6000 MIG 24GB GPUs. Each regression took approximately 4–8 hours to fit at $2.77/hour, so each fit cost roughly $11.08–$22.16 (USD).

Table 3: Total counts of input, output, and reasoning tokens consumed by the three-member LLM-as-a-judge jury while grading evaluated LLM and human responses, broken out by task and overall. Coverage spans all results, including main results, reasoning and temperature ablations, and LLM responses to the human baseline items (reported under "Open"). Rows with generation or LLM-as-a-judge errors are excluded. $_{R}$ indicates reasoning models that had reasoning turned on during evaluation. (Reflects main run configuration only).

Table 4: Mean counts of input, output, and reasoning tokens consumed by the three-member LLM-as-a-judge jury while grading evaluated LLM and human responses per generation, rounded to the nearest whole token, broken out by task and overall. Coverage spans all results, including main results, reasoning and temperature ablations, and LLM responses to the human baseline items (reported under "Open"). Rows with generation or LLM-as-a-judge errors are excluded. $_{R}$ indicates reasoning models that had reasoning turned on during evaluation. (Reflects main run configuration only).
